Introduction:

Shifty is a digital web-based solution designed to streamline shift handovers in operational environments (such as NOC/SOC/IT Operations). It provides a structured and intuitive interface for managing tasks, logging incidents, recording handover notes, and ensuring clear communication between shifts.

The system was developed to reduce human error, promote operational continuity, and allow team members to access real-time shift data, track task urgency, and view historical shift records – all from a centralized and user-friendly interface.

Key Features:

- Task Management Interface:

Operators can log new tasks, assign urgency levels, mark completion status, and view pending action items.

- Incident and Ticket Logging:

Track system issues and service requests with timestamps, resolution status, and optional severity.

- Knowledge Transfer Panel:

Dedicated section for leaving notes and recommendations for the next shift.

- Calendar-Based Shift Selection:

Browse or edit previous shifts via a date picker instead of manually typing the date.

- Visual Indicators & Priority Colors:

UI uses urgency-based color themes (Red, Orange, Green) for immediate clarity.

- Different System Integrations
  - Outlook: Shift reminders and task alerts
  - Control-M: Scheduled jobs and alerts
  - OMi: Monitoring and system health alerts

Benefits:

- Reduce miscommunication and knowledge loss between shifts
- Enhance operational efficiency and transparency
- Provide a structured platform for tracking technical and procedural workflows
- Scalable architecture designed for future integration and role-based access control

Demo of the Project:

Login Interface:
Basic authentication allows the operator to log in securely. Future plans include enterprise integration (LDAP/AD).

Landing Page – Shift Dashboard:
View current open tasks, unresolved incidents, and previous shift notes.

New Task Entry:
Input title, description, urgency level, and assign to current or next shift.

Incident Logging:
Document unexpected issues, including timestamps, system impacted, and resolution progress.

Notes for Next Shift:
Type in free-form notes or select from pre-defined templates (e.g. “Check backup status”).

Shift Calendar:
Select a date to load the shift history. Enables browsing past data without complex filters.

End-of-Shift Summary:
Final review screen with a summary of completed tasks, open issues, and alerts.

Data Export (Planned):
Export shift summary as a printable PDF or send as automated email (via Outlook API).

Tools & Technologies:

Tool / Technology	Purpose	Role in the Project
HTML + CSS	UI & layout	Builds the front-end layout and visual elements
JavaScript	Interactivity & DOM handling	Handles task logic, form submissions, and color logic
Node.js + Express	Backend	Used for server logic, planned DB integration
Outlook API	Alerts & email simulation	Extracting Alerts and relevant information form the group email
Control M API	Monitoring jobs and alerts	Extracting Alerts about jobs and tasks
OMI API	Monitoring alerts	Extracting Alerts about storage, connectivity and services

Main Logic and Flow:

- **Login & Access Control**

Entry point for authenticated use. Placeholder authentication for now; scalable to enterprise login.

- **Initialize UI Components**

Loads urgent tasks, unresolved issues, and previous notes for context.

- **User Actions:**

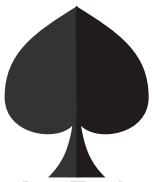

1. Add/edit task
2. Log new incident
3. Add shift note
4. Mark issue as resolved
5. Filter by urgency

- **Simulated Integrations Triggered Automatically:**

1. Mock Outlook sends notification 15 mins before shift end
2. Control-M "job view" simulates scheduled task list
3. OMi alert icon shows simulated infrastructure health

- **Shift Summary & Save:**

Final review with option to export data or pass to next shift.
